Understanding Proteins Dec 09 2020 When Watson and Crick in 1953 discovered the double helix structure of DNA they claimed to have discovered the secret of life. In biological terms there is much truth in that, because of course the structure of DNA tell us much about how it replicates and passes on information, But let us not forget what the DNA code is actually coding for - proteins! That's right - every single gene is a code that instructs the cell which of the 20 amino acids to put in which places in order to make the structure of that particular protein; be it insulin or amylase. So - it could be argued that proteins are the molecules of life - the business end if you like - where the action really happens. What I have done in this book is to explain in question and answer form, the structure and function of proteins in a clear and easily understood manner. I know reading this book will improve your understanding of biochemistry and biology - and I am delighted to recommend it to you.

Development of Selective DNA-Interacting Ligands Apr 24 2022 This book addresses the development of both DNA-sequence-selective and DNA-form-selective ligands, with the aim of creating potential molecular probes and therapeutic agents for non-canonical DNA structure-caused human diseases. Over the past two decades, the structural diversity of DNA forms has been proven to have profound implications in various biological, neurological, and pharmacological events. In response, researchers have since made tremendous efforts to obtain highly active drugs interacting with disease-related non-canonical DNA structures. These drugs, however, have not yet been approved for clinical use. One obstacle impeding their clinical application has to do with selectivity. This book focuses on secondary DNA structures formed by trinucleotide repeat sequences ("hairpin form") or guanine-rich sequences ("G-quadruplex form"), both of which are pathological molecules for neurodegenerative diseases and/or cancer. Most importantly, it contends that a particular secondary structure of DNA in the context of the human genome can be targeted with a minimal affinity to other DNA structures by means of careful and rational ligand design. This approach opens an avenue to the development of highly selective drugs or diagnostic chemical tools for human diseases. Readers who want to know how synthetic ligands can be designed to selectively target a certain DNA molecule will find this book highly informative.

A Passion for DNA Jul 04 2020 A collection of outspoken and topical essays, speeches, and reports by J. D. Watson, co-discoverer of the structure of DNA in 1953 and best-selling author of The Double Helix. These often controversial pieces cover the advance of molecular genetics, the prospect of curing cancer over the next decade, how human genetic knowledge is likely to be used, for good or bad, and Watson's early life and career.

DNA Methylation and Cancer Therapy Sep 05 2020 NA methylation has bewildered molecular biologists since Hotchkiss discovered it almost six decades ago (Hotchkiss RDJ. Biol Cem 1948; 175:315-332). The fact that the chemical structure of our D genome

consists of two components that are covalently bound, the genetic information that is replicated by the DNA replication machinery and DNA methylation that is maintained by independent enzymatic machinery, has predictably stimulated the imagination and curiosity of generations of molecular biologists. An obvious question was whether DNA methylation was a bearer of additional information to the genetic information and what was the nature of this information? It was tempting to speculate that DNA methylation applied some form of control over programming of the genome's expression profile. Once techniques to probe the methylation profile of whole genomes as well as specific genes became available, it became clear that DNA methylation patterns are gene and tissue specific and that patterns of gene expression correlate with patterns of methylation. DNA methylation patterns emerged as the only component of the chemical structure of DNA that exhibited tissue and cell specificity. This data seemingly provided an attractively simple explanation for the longstanding dilemma of how could one identical genome manifest itself in so many different forms in multicellular organisms? The DNA methylation pattern has thus become the only known factor to confer upon DNA a unique cellular identity.

Die Kapitel 5 und 6 beschäftigen sich noch eingehender mit der dreidimensionalen Struktur der DNA. Hier gibt es kleine Exkurse in Mathematik und Geometrie. Kapitel 7 liefert einen Überblick über die Organisation der Chromosomen, große Partikel, die sowohl Protein als auch DNA enthalten: Dort wickelt sich die DNA in verschiedenen Strukturebenen um das Protein. In Kapitel 8 wird der Mechanismus des "direkten Lesens" ("direct reading") von DNA-Sequenzen durch Proteine behandelt. Kapitel 9 erläutert die verschiedenen Versuchstechniken, mit deren Hilfe Wissenschaftler die DNA erforschen. Das Kapitel 10 beschreibt, wie DNA-Techniken immer mehr Anwendung in der Medizin finden. Das neu hinzugekommene Kapitel 11 fasst schließlich das rasch an Bedeutung zunehmende Gebiet der Cytosin-Methylierung und DNA-Epigenetik zusammen. Jeweils am Kapitelende sind einige Übungen, eine Auswahl weiterer Literatur und Hinweise auf Quellen im Internet beigefügt.

Bidirectional Gene Promoters Nov 07 2020 Recent studies in human genetics and in silico analyses have revealed that a number of genes are head-head orientated with other genes or non-coding RNAs. The expression of regulatory element-containing 5'-upstream regions of gene pairs are referred to as bi-directional promoters and are thought to have a key role in biological regulatory mechanisms. For example, tumor suppressor protein-encoding TP53 and BRCA1 genes are head-head bound with WRAP53 and NBR2, respectively. DNA-repair factor-encoding ATM and PRKDC (DNA-PKcs) genes have bidirectional partner NPAT and MCM4, respectively. Surveillance of the human DNA database has revealed that the numbers of DNA repair/mitochondrial function/immune response-associated genes are bound with other genes that are transcribed to opposite direction. The observations may encourage us to investigate in the molecular mechanisms how DNA repair/mitochondrial function/immune response-associated genes are regulated by bidirectional promoters. Not only protein-coding genes, but also quite a few ncRNAs, which play important roles in various cellular events, are transcribed under the regulation of the bidirectional promoters. More importantly, we know that dysregulation in the

promoter activity and transcription initiation of genes might cause human diseases. Provides an overview of the process of transcription Explains why there so many bidirectional promoters present in human genomes Covers how the diverse biological functions of (non-coding RNAs) ncRNAs are controlled

Non-Neutral Evolution Jun 02 2020 All organisms--from the AIDS virus, to bacteria, to fish, to humans--must evolve to survive. Despite the central place of evolution within biology, there are many things that are still poorly understood. For Charles Darwin, the driving force behind all evolution was natural selection. More recently, evolutionary biologists have considered that many mutations are essentially neutral with respect to natural selection. Many questions remain. Are molecular differences between species adaptive? Are differences within species adaptive? Modern biotechnology has enabled us to identify precisely the actual DNA structure from many individuals within a population, and thus to see how these DNA sequences have changed over time and to answer some of these questions. At the same time, this knowledge poses new challenges to our ability to understand the observed patterns. This exciting volume outlines the biological problems, provides new perspectives on theoretical treatments of the consequences of natural selection, examines the consequences of molecular data, and relates molecular events to speciation. Every evolutionary biologist will find it of interest.

The Double Helix Oct 31 2022 The classic personal account of Watson and Crick's groundbreaking discovery of the structure of DNA, now with an introduction by Sylvia Nasar, author of A Beautiful Mind. By identifying the structure of DNA, the molecule of life, Francis Crick and James Watson revolutionized biochemistry and won themselves a Nobel Prize. At the time, Watson was only twenty-four, a young scientist hungry to make his mark. His uncompromisingly honest account of the heady days of their thrilling sprint against other world-class researchers to solve one of science's greatest mysteries gives a dazzlingly clear picture of a world of brilliant scientists with great gifts, very human ambitions, and bitter rivalries. With humility unspoiled by false modesty, Watson relates his

and Crick's desperate efforts to beat Linus Pauling to the Holy Grail of life sciences, the identification of the basic building block of life. Never has a scientist been so truthful in capturing in words the flavor of his work.

Double Helix Sep 29 2022 To the untrained eye, Photo 51 was simply a grainy black and white image of dark marks scattered in a rough cross shape. But to the eye of a trained scientist, it was a clear portrait of a DNA fiber taken with X-rays. And to young scientists James Watson and Francis Crick, it confirmed their guess of deoxyribonucleic acid's structure. In 1953 the pair was racing toward solving the mystery of DNA's structure before other scientists could beat them to it. They and others believed that finding the simple structure of the DNA molecule would answer a great mystery, how do organisms live, grow, develop, and survive, generation after generation? Photo 51 and subsequent models based on the photo would prove to be the key to unlocking the secret of life.

They Changed the World: Crick & Watson - The Discovery of DNA Mar 31 2020 Since the dawn of civilization, we have searched for answers to what makes life possible, and in the mid-twentieth century we found them through the persistent efforts of James Watson and Francis Crick. Although the groundwork for the discovery had already been laid out, it was Watson and Crick's derivation of the three-dimensional, double-helical model for the structure of DNA that solved the final piece of the puzzle and won them the Nobel Prize in Physiology or Medicine in 1962. That is only a single moment of triumph, though, and the journey they took to get there was a long and arduous one. Find out how Crick and Watson beat their rivals to unlock the secrets of life itself as they unravelled the mystery behind DNA and changed not only science but the world we live in.
