probability of 3 people in a room of 30 having the same birthday Apr 08 2021 13 12 2013 then this approximation gives  $f \approx 0.365$  and therefore the probability of three or more people all with the same birthday is approximately 0.6400 wolfram alpha gives the probability as 0.6459 contrast this with the accepted answer which estimates the probability at 0.7029

[how to find probability of an event step by step explanation](#) Nov 15 2021 the probability of an impossible event is zero whereas the probability of a sure event is one probability as the name deals with uncertainty probability problems are difficult to deal with but it becomes easy with a little help from the subject experts in this article we will take a step by step look at what probability is and how to find the probability of an event

basic concepts of probability github pages Oct 26 2022 in such a situation we wish to assign to each outcome such as rolling a two a number called the probability of the outcome solution the outcomes could be labeled according to the number of dots on the top face of the die then the sample space is the set  $s = \{1, 2, 3, 4, 5, 6\}$  the outcomes that are even are 2 4 and 6 so the event that corresponds to the phrase an even

the problem of induction stanford encyclopedia of philosophy Jul 11 2021 21 03 2018 after presenting the problem hume does present his own solution to the doubts he has raised e 5 t 1 3 7 16 this consists of an explanation of what the inductive inferences are driven by if not reason in the treatise hume raises the problem of induction in an explicitly contrastive way he asks whether the transition involved in the inference is produced by

monty hall problem solution explained simply statistics how to Sep 25 2022 if you count the number of wins losses in the result column you get 6 9 which is a probability of winning of  $\frac{2}{3}$  back to top the media furor as to why this probability problem became so famous has a lot to do with the media furor that followed marilyn s answer in the ask marilyn column which was disagreements with the solution

[infinite monkey theorem wikipedia](#) Jun 10 2021 solution direct proof there is a straightforward proof of this theorem as an introduction recall that if two events are statistically independent then the probability of both happening equals the product of the probabilities of each one happening independently for example if the chance of rain in moscow on a particular day in the future is 0.4 and the chance of an earthquake in san

ncert solution class 12 chapter 13 probability exercise 13 4 Jul 31 2020 solution here we have table with values for x and p x as we know the sum of all the probabilities in a probability distribution of a random variable must be one hence the sum of probabilities of given table 0 4 0 4 0 2 1 hence the given table is the probability distributions of a random variable solution

independence probability theory wikipedia Mar 07 2021 independence is a fundamental notion in probability theory as in statistics and the theory of stochastic processes two events are independent statistically independent or stochastically independent if informally speaking the occurrence of one does not affect the probability of occurrence of the other or equivalently does not affect the odds

100 prisoners problem wikipedia Feb 24 2020 therefore the probability that all prisoners find their numbers is the product of the single probabilities which is  $1/2^{100}$  a vanishingly small number the situation appears hopeless solution strategy surprisingly there is a strategy that provides a survival probability of more than 30 the key to success is that the

1 gambler s ruin problem columbia university Aug 12 2021 solution the probability he becomes infinitely rich is  $1 - q/p$  if  $1 < q/p < 3$  so the probability of ruin is  $2/3 - 1/2$  applications risk insurance business consider an insurance company that earns 1 per day from interest but on each day independent of the past might suffer a claim against it for the amount 2 with probability q

40 questions on probability for data science analytics vidhya Feb 18 2022 10 04 2017 solution a the probability of offspring being red is 0 25 thus the probability of the offspring not being red is 0 75 since all the pairs are independent of each other the probability that all the offspring are not red would be  $0.75^5 = 0.237$  you can think of this as a binomial with all failures

solution identify probability values which of the following Dec 16 2021 the most the probability of an event occurring can be is 1 which means the event has a 100 probability of happening but 2 is greater than 1 so it cannot be a probability finally 5/3 is not a probability for the same reason that 2 is not a probability it is greater than 1 hope this helps you understand probability a little better

logistic regression wikipedia Aug 20 2019 but the effect on the probability of is not as much as 10 times greater it s only the effect on the odds that is 10 times greater multinomial a possible method of solution is to set the derivatives of the log likelihood with respect to each beta coefficient equal to zero and solve for the beta coefficients where  $\beta_m$  is the m th coefficient of the vector and  $\beta_m$  is the m th
