High-Pressure Shock Compression of Solids II Oct 25 2019 This volume concerns the fracture and fragmentation of solid materials that occurs when they are subjected to extremes of stress applied at the highest possible rates. The plan for the volume is to address experimental, theoretical, and com putational aspects of high-rate dynamic fracture and fragmentation, with emphasis on recent work. We begin with several chapters in which the emphasis falls on experimental methods and observations. These chapters address both macroscopic responses and the microscopic cause of these re sponses. This is followed by several chapters emphasizing modeling-the physical explanation and mathematical representation of the observations. Some of the models are deterministic, while others focus on the stochastic aspects of the observations. Often, the ov\!rall objective of investigation of dynamic fracture and fragmentation phenomena is provision of a means for predicting the entire course of an event that begins with a stimulus such as an impact and proceeds through a complicated deformation and fracture pro cess that results in disintegration of the body and formation of a rapidly expanding cloud of debris fragments. Analysis of this event usually involves development of a continuum theory and computer code that captures the experimental observations by incorporating models of the important pheno mena into a comprehensive description of the deformation and fracture pro cess. It is to this task that the work of the last few chapters is devoted.

Arming the Luftwaffe Feb 09 2021 During World War II, aviation was among the largest industrial branches of the Third Reich. About 40 percent of total German war production, and two million people, were involved in the manufacture of aircraft and air force equipment. Based on German records, Allied intelligence reports, and eyewitness accounts, this study explores the military, political, scientific and social aspects of Germany’s wartime aviation industry: production, research and development, Allied attacks, foreign workers and slave labor, and daily life and working conditions in the factories. Testimony from Holocaust survivors who worked in the factories provides a compelling new perspective on the history of the Third Reich.
In the Teeth of the Wind Feb 21 2022 So rapid have been the advances in the science of aeronautics since the end of the First World War that it requires a considerable feat of imagination to cast one's mind back over the comparatively short period of seventy years to the days when Flight Commander Bartlett of the Royal Naval Air Service was flying some of the world's first bombers over the Western Front.An equal adjustment for those more used to accounts of the nerve-chilling existence of bomber crews in the Second World War is called for when tuning in to the extra ordinarily happy-go-lucky atmosphere which seemed to prevail among these early pilots. Not for them the nail-biting tension as they head over the trenches - rather the schoolboy exuberance of a jolly outing.Philip Bartlett's account is a unique and fascinating record of a pilot's life in the dawn of aerial warfare and, as history, of the first use of the bomber in war, strangely, by the Navy's aircraft.Flying by day and night alone, without navigational aids, the author moves from attacks on the U-boat bases to bombing the German Gothas as they prepared to raid London, and then to the support of Haig's drive to the coast which ended in the mud of Passchendaele. The climax in March, 1918, is reached when the author's squadron finds itself directly in the path of Ludendorff's massive thrust, which broke the British Vth Army and nearly decided the War. Attacked by Richthofen's aces, No 5 Squadron RNAS flew continuous and desperate missions against the advancing troops from aerodomes which were over-run time after time. At a time when the life of a pilot was reckoned in weeks, the author flew 101 missions, enduring the rigours of flying without heating or oxygen, with hesitant engines, no parachutes and the attention of German fighters. Yet there is continual evidence of the pure joy of flying and wonder at the sheer beauty of the the sky.
Simulating Good and Evil Aug 03 2020 Simulating Good and Evil shows that the moral panic surrounding violent videogames is deeply misguided, and often politically motivated, but that games are nevertheless morally important. Simulated actions are morally defensible because they take place outside the real world and do not inflict real harms. Decades of research purporting to show that videogames are immoral has failed to produce convincing evidence of this. However, games are morally important because they simulate decisions that would have moral weight if they were set in the real world. Videogames should be seen as spaces in which players may experiment with moral reasoning strategies without taking any actions that would themselves be subject to moral evaluation. Some videogame content may be upsetting or offensive, but mere offense does not necessarily indicate a moral problem. Upsetting content is best understood by applying existing theories for evaluating political ideologies and offensive speech.

Review of Progress in Quantitative Nondestructive Evaluation Sep 23 2019 This volume (parts A and B) contains the edited papers presented at the annual Review of Progress in Quantitative NDE held at the University of California, San Diego, July 8-13, 1984. We have chosen to organize the papers by subject, an arrangement that we feel to be more useful for a reference volume than the order of paper presentation at the Review. To do this, topical subject headings have been selected under which the large majority of papers reasonably fall. These categories cover a broad spectrum of research in NDE and encompass activities from funda mental work to early engineering applications. The scope and depth of the Review may be

easily assessed by examination of the Table of Contents. The Review was sponsored by the Center for Advanced NDE at the Ames Lab oratory of the U.S. Dept. of Energy in cooperation with the Office of Basic Energy Sciences, USDOE, the Materials Laboratory at Wright-Patterson AFB, and the Naval Sea Systems Command. Approximately 300 attendees re presenting various government agencies, industry, and universities parti cipated in the technical presentations, poster sessions, and discussions. This Review, possibly the most comprehensive annual symposium in NDE, provides a valuable forum for the timely exchange of technical informa tion. A few highlights of the Review are summarized in the following paragraphs.
